3 Getting Started

Gather Supplies
- Gather the following supplies for each dose and put them on your FUSEON Preparation Mat at room temperature:
  - One vial of FUSEON—at room temperature
  - One vial of saline
  - One 3-cc, syringe with a 1-inch needle
  - One 3-cc, needle syringe with a 1/2-inch needle
  - Alcohol pads

Shake container

Mixing Two Doses

To mix two doses:
- At room temperature, you can combine your daily dose of FUSEON at the same time, but you will need to keep the second dose of unused FUSEON in the refrigerator. Do not mix unused FUSEON in the syringe.

Once needleless devices have been added to the refrigerator, the red can be placed in the refrigerator. The FUSEON will stay in the refrigerator until you need it.
- Before using the dose of refrigerated FUSEON, be sure to shake it and allow it to warm to room temperature. You may want to hold it in your hand to bring it to room temperature before mixing.
- Mixed FUSEON must be used within 2 hours.
- The instructions below are for mixing a single dose. If you need to mix two doses at the same time, be sure to use new needleless pads, syringes, maneuvers, and sterile water.
- Write the date and time on the red label if you are mixing the dose to be used later.

4 Mixing FUSEON

Draw Up Sterile Water
- Gently tap the FUSEON vial to break the vial.
- Pick up the 3-cc, needle syringe.
- Using your index finger, pull the colored protection device away from the needleless device.
- To ensure that the needle is secured, hold the clear plastic cap tight and tighten the needle with a gentle twisting motion. Do not use too much force as you can damage the needle.
- Pull the clear plastic cap off.
- Pull the plunger back to 1 cc, of air (mm Hg).
- Before mixing the sterile water and syringe, gently inject the air into the vial—and keep the needle in the vial.
- Turn the vial upside down. Make sure the needle is always below the surface of the solution to help keep air bubbles from entering the syringe.
- (Or) Pull the plunger back to 2 cc of sterile water or saline or move the air to the side of the needle, so you need to use the plunger from the 1 cc, syringe, at 1 cc, per 1 cc, dose.
- Carefully remove the needle and syringe from the vial.

Inject Sterile Water into FUSEON
- Insert the syringe needle into the FUSEON vial at an angle.
- Insert the needle make sure that it dips down the side of the vial into the powder.
- Return the needle to the vial. Using your hand, gently prime the colored protection device away from the needleless device.
- Put the used syringe in the Sharps container.

Gently Mix FUSEON
- Gently tap FUSEON at room temperature and wait for your fingers to feel warm to the touch.
- (Or) Mix FUSEON vial and wait for your fingers to feel warm to the touch.
- Normally mix the FUSEON vial between your hands to reduce air into the solution. You can also use a 3-cc syringe under the lid of the vial to mix.
- After mixing, it could take up to 90 minutes to dissolve FUSEON. FUSEON should be used within 24 hours.

Inject FUSEON into the abdomen
- Whom completely mixed the liquid FUSEON should be clear.
- (Or) gently mix the liquid FUSEON should be clear.
- Before mixing, the FUSEON vial must be completely mixed.
- If you use 1 cc, of sterile water or saline or move the air to the side of the needle, so you need to use the plunger from the 1 cc, syringe, at 1 cc, per 1 cc, dose.
- Carefully remove the needle and syringe from the vial.

Inject FUSEON
- Decide on the site for injection, and use a needleless pad.
- Use a needleless pad to protect the skin from the needleless device.
- At the injection site, apply pressure and then in a circular motion, work out the air.
- Allow the site to air dry.

Draw Up FUSEON
- Clean the FUSEON vial top again, using a new needleless pad. Allow to air dry.
- (Or) use a needleless pad.

Administer
- (Or) use the needleless device tightly by pushing it down sharply while twisting its clamps.
- Using the plunger, push the colored protection device away from the needleless device.
- Pull the clear plastic cap off.
- Pull the plunger back to 1 cc, of air (mm Hg).
- Before mixing the sterile water and syringe, gently inject the air into the vial—and keep the needle in the vial.
- Gently tap the needleless device.

Implement
to the injection site.
- Gently tap FUSEON at room temperature and wait for your fingers to feel warm to the touch.
- (Or) Mix FUSEON vial and wait for your fingers to feel warm to the touch.
- Normally mix the FUSEON vial between your hands to reduce air into the solution. You can also use a 3-cc syringe under the lid of the vial to mix.
- After mixing, it could take up to 90 minutes to dissolve FUSEON. FUSEON should be used within 24 hours.

Inject FUSEON
- Decide on the site for injection, and use a needleless pad.
- Use a needleless pad to protect the skin from the needleless device.
- At the injection site, apply pressure and then in a circular motion, work out the air.
- Allow the site to air dry.

Draw Up FUSEON
- Clean the FUSEON vial top again, using a new needleless pad. Allow to air dry.
- (Or) use a needleless pad.

Administer
- (Or) use the needleless device tightly by pushing it down sharply while twisting its clamps.
- Using the plunger, push the colored protection device away from the needleless device.
- Pull the clear plastic cap off.
- Pull the plunger back to 1 cc, of air (mm Hg).
- Before mixing the sterile water and syringe, gently inject the air into the vial—and keep the needle in the vial.
- Gently tap the needleless device.

Implement
to the injection site.

5 Giving the Injection

Choose the Injection Site
- Using your FUSEON Pincer to help you, choose a site different from the one you used for your last injection.

Importante!
- With the tips of your fingers, feel for any hard lumps. Do not inject FUZEON into the following areas: near the abdomen, breast, penis, the inner or outer labia, directly over a blood vessel, around the naval, the chest, the buttocks, the thigh, the abdomen, thigh or arm.
- Carefully remove the needle and syringe from the vial.
